

WhatsApp AI Chat Agent.”

⚙️ How It Works (Step-by-Step Flow)

1. 📱 WhatsApp Trigger

- This is the **entry point**.
- The workflow starts automatically whenever a **WhatsApp message is received** (e.g., from a customer or user).
- It captures the message text, sender info, etc.

2. 🤖 AI Agent

- This is the **core brain** of the system.
- It receives the WhatsApp message and processes it using an **AI model** and **memory system**.
- It's connected to:

- **Google Gemini Chat Model** (for generating intelligent responses)
- **Simple Memory** (for storing past user interactions or context)

- The AI Agent decides what reply to generate.

3. **Google Gemini Chat Model**

- Provides **language understanding and response generation**.
- The model interprets the input text (user's WhatsApp message) and produces a natural-language reply.

4. **Simple Memory**

- Keeps a **record of the conversation history**, so the agent can remember previous messages and maintain context across multiple user interactions.

5. **Send Message**

- After the AI Agent generates a reply, this block **sends the response back to WhatsApp**.
- The user on WhatsApp sees the message as if chatting with a real assistant.

Summary of Its Function

This is a **WhatsApp AI Chatbot** powered by **Google Gemini**, designed to automatically:

- Receive incoming messages via WhatsApp
- Process and understand the text using Gemini
- Store context with Simple Memory
- Send smart, contextual replies back via WhatsApp
