

Facebook Ads Scraper

- **Purpose of the Workflow:** The core purpose is to automate the scraping, cleaning, regeneration, and distribution of high-performing Facebook ad copy. It scrapes successful ads from the Facebook Ad Library via a tool like Apify, cleans the text, uses an AI Agent to rewrite and generate new ad variations, saves the data to Google Sheets, creates a Google Docs file, and then notifies a team via Gmail.

Workflow Steps and Components

The full workflow is a complex, automated pipeline connecting multiple services, primarily built within an automation platform (likely n8n, given the interface).

Step	Component (Node)	Action / Function
1	When clicking "Execute workflow" (Manual Trigger)	Starts the process manually.

2	Get Facebook Ads (Google Sheets)	Retrieves a list of high-performing Facebook ad URLs from a Google Sheet named "Facebook ads"
3	Facebook Ads Scraper (Run an Actor - Apify)	Runs an Apify actor using the collected URLs as input to scrape the full ad data (page name, ad copy, video URL, etc.) from the Facebook Ad Library
4	Get Facebook Ads Data (Get dataset items - Apify)	Retrieves the actual scraped ad data from the Apify dataset created in the previous step (5:07-5:24).
5	FB Ads Data (Google Sheets)	Appends the original scraped ad data (Page Name, Ad Copy, Video URL, etc.) to a Google Sheet named "ad copy templates"
6	Ads Copy Cleaner (OpenAI Chat Model)	Cleans the scraped ad copy by removing emojis, tracking links, extra line breaks, and ensuring correct grammar/punctuation
7	Facebook Ads Generator (AI Agent)	A custom AI Agent (defined with a detailed System Prompt, Model, Memory, and "Think" tool) that uses the <i>cleaned</i> ad copy as inspiration to regenerate 5-10 completely new, high-converting ad variations tailored to the user's business
8	Wait 5 Seconds (Wait)	Pauses the workflow briefly to prevent overwhelming Google Sheets

9	New Ads Data (Google Sheets)	Appends the newly regenerated ad variations (Angle, Headline, Primary Text, CTA) to a separate Google Sheet named "new ad copy template"
10	Create Ads document (Google Docs)	Creates a new Google Doc file using one of the new Headlines as the document title
11	Update Ads document (Google Docs)	Inserts the primary text (ad copy) of the regenerated ad variation into the newly created Google Doc
12	Team notification (Gmail)	Sends an email to the team with a celebratory subject and body, including a link to the newly created Google Docs file .
13	No Operation, do nothing	The final node, indicating the end of the workflow execution..

Result

The final image, `prac-5-result.png`, displays the email notification sent to the team , confirming the successful execution of the entire pipeline.

- Email Subject (Implied from text): "new ads scraped and rewritten" or similar
- Email Body Highlights:
 - "Hi Team, Great news — new ads have just been scraped and rewritten for you 🚀"
 - Scraped ads cleaned and processed
 - Fresh ad variations generated using proven high-converting structures
 - Ready-to-use JSON output for your campaigns

- Includes a direct link (<https://docs.google.com/docume...>) to the Google Doc containing the new ad copy.
- **Final Output (Google Doc - shown in text analysis):** The accompanying Google Doc contains the Headline and the Ad Copy generated by the AI agent.

Result

Hi Team,

Great news — new ads have just been scraped and rewritten for you! 🚀

Here's what's ready:

- * ✅ Scraped ads cleaned and processed
- * ✅ Fresh ad variations generated using proven high-converting structures
- * ✅ Ready-to-use JSON output for your campaigns

You can review the latest batch here:

<https://docs.google.com/document/>

This ensures you always have unique, conversion-ready ad copy without the manual work.

Helping you save time, scale outreach, and close more clients.
